

First set up Ruby:

Change user rights so you do not need sudo

```
sudo chmod -R 770 /var/lib/gems
sudo chmod -R 770 /usr/local/bin
```

Install the latest Ruby with RVM.

```
gpg --keyserver hkp://keys.gnupg.net --recv-keys \
409B6B1796C275462A1703113804BB82D39DC0E3
curl -sSL https://get.rvm.io | bash -s stable --ruby
/bin/bash --login
rvm install 2.3.0
rvm use 2.3.0
rvm rubygems latest
ruby --version
rvm install ruby-dev
For other issues with the Ruby installation, follow this.
After that, it worked for me.
```

Then install jekyll for github pages with

```
gem install github-pages
```

That is all.
